HAZARDSCRC

MITIGATING THE EFFECTS OF SEVERE FIRES, FLOODS AND HEATWAVES THROUGH IMPROVEMENTS TO LAND DRYNESS MEASURES AND FORECASTS

Vinod Kumar & Imtiaz Dharssi

Bureau of Meteorology, Melbourne

An Australian Government Initiative

Introduction

- The McArthur Forest Fire Danger Index (FFDI) uses "Drought Factor" (DF) to represent fuel availability.
- DF is based on soil moisture deficit.
- SMD in DF is commonly calculated as either:
 - Keetch–Byram Drought Index (KBDI)
 - Mount's Soil Dryness Index (SDI).
- KBDI/SDI make empirical assumptions to moisture depletion in the upper soil layers.

KBDI/SDI in more detail

KBDI

Assumes:

- Rate of moisture loss due to ET is a function of vegetation cover density.
- VCD is an exponential function of mean annual rainfall.
- ET is an exponential function of T_{max} .
- Maximum water available for transpiration is 203.2 mm.

SDI

- Based on KBDI.
- But interception and runoff are treated separately.
- The interception and runoff is based on seven vegetation categories.
- ET is a linear function of T_{max} .

Objective I

Production of historical KBDI/SDI data sets

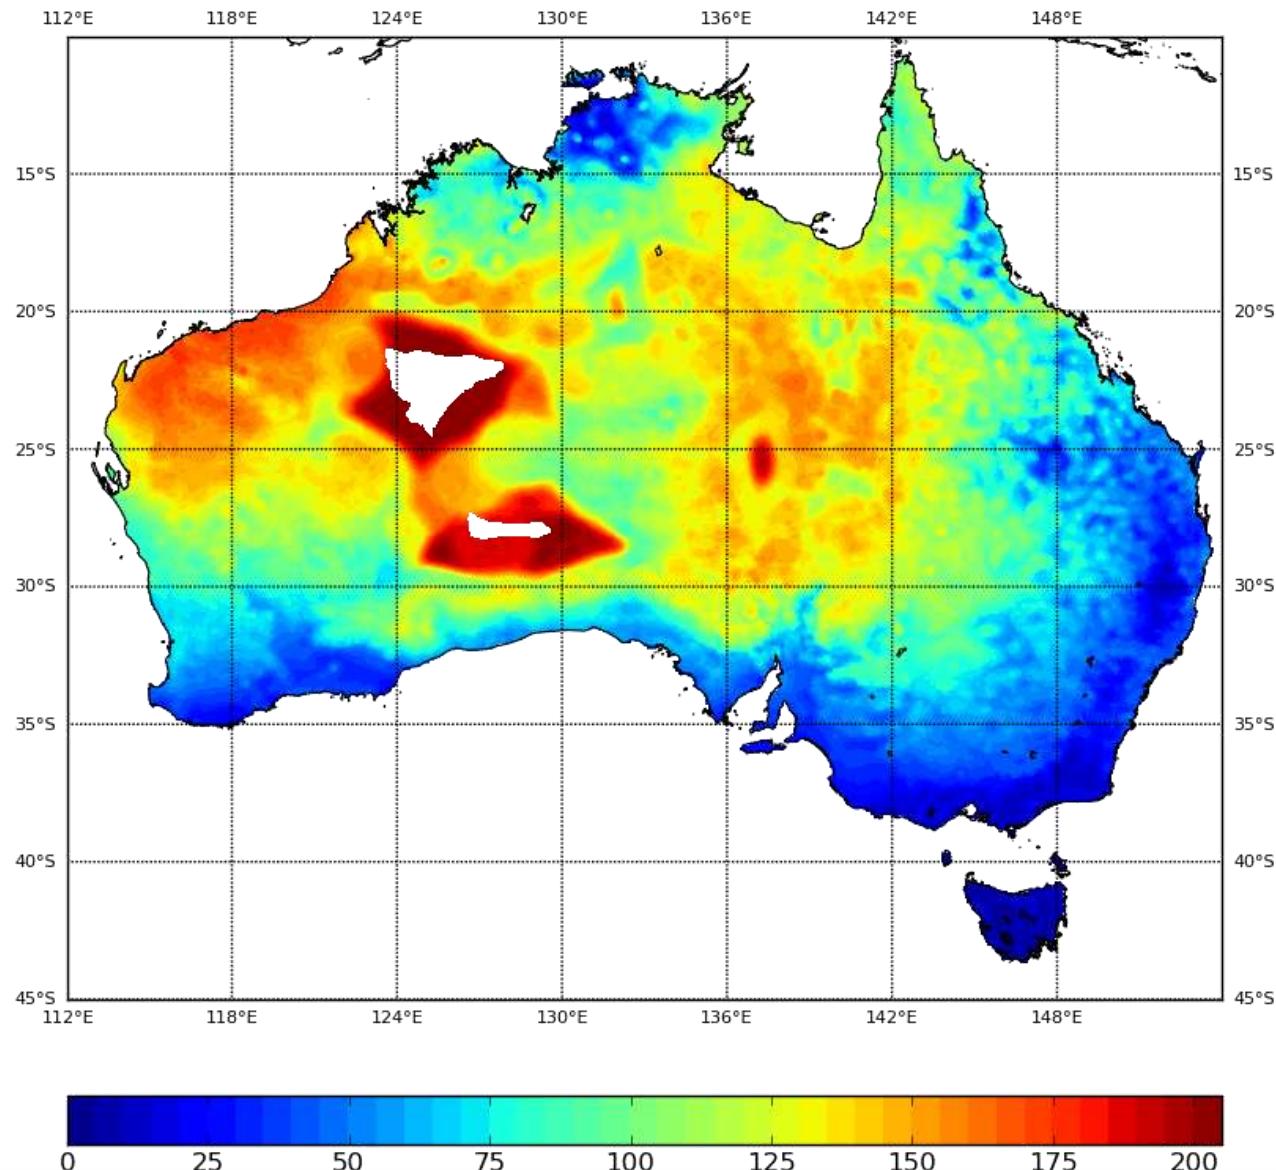

- Produced 40 year (1974 – 2014) KBDI and SDI data set.
- For whole of Australia.
- Daily.
- At ~5 km spatial resolution.
- Data

Input rainfall and T_{Max} fields from AWAP.

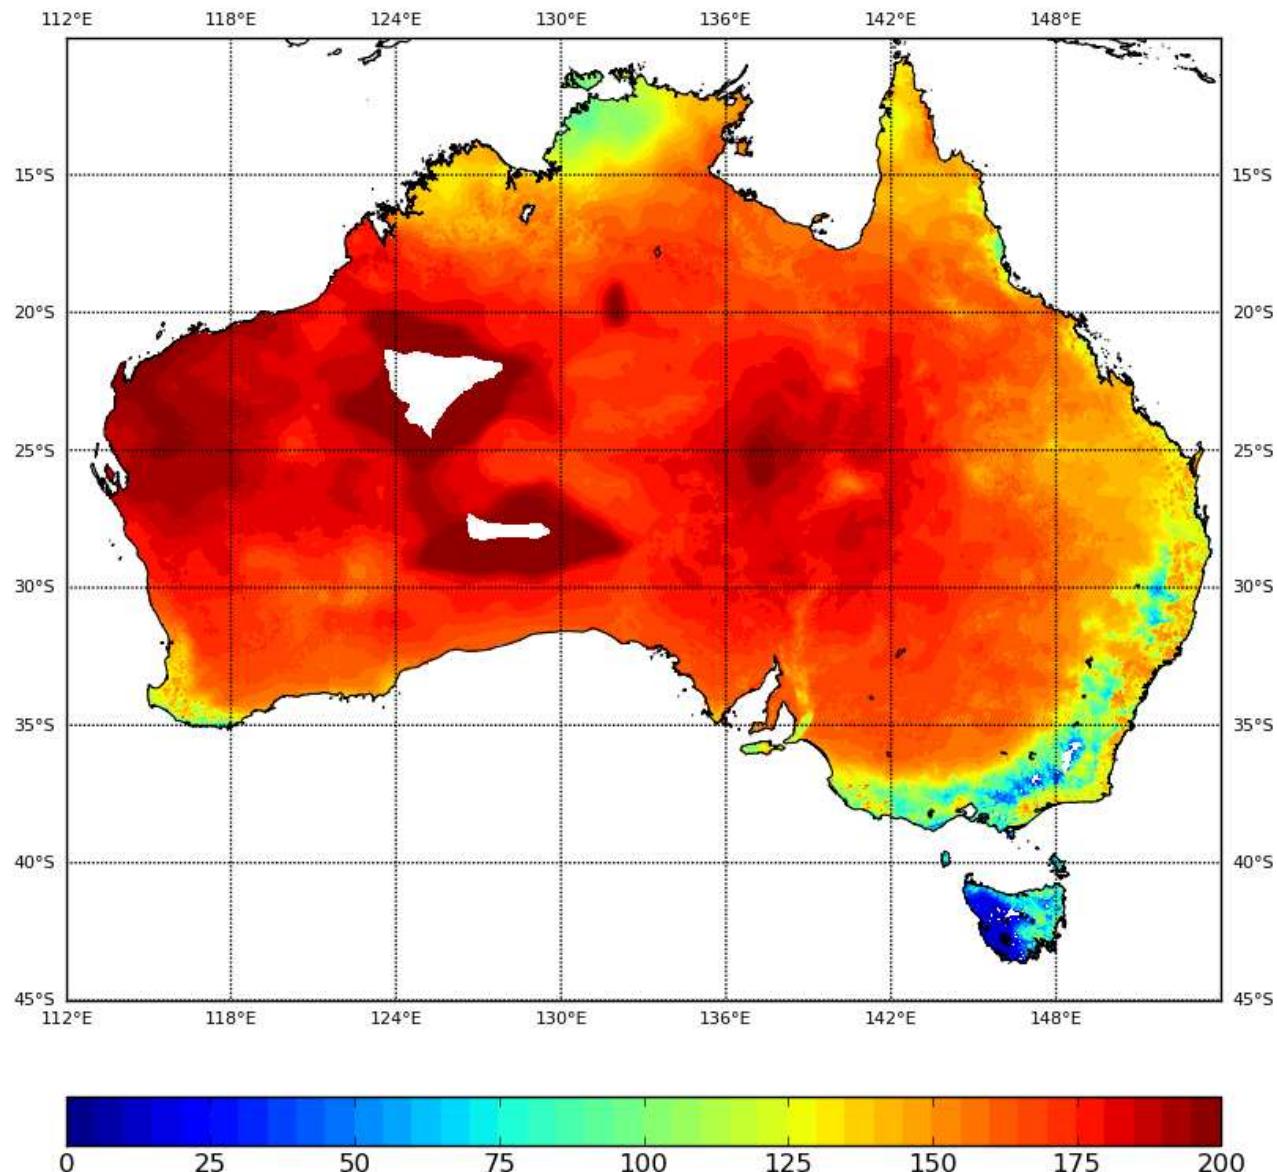

Vegetation class from MODIS LAI (Courtesy AUSCOVER).

SDI: ET coefficients & Veg Class parameter values from operations.

Mean KBDI -- Dec

Mean SDI -- Dec

Objective II

Inter-comparison of KBDI/SDI with other sources

The selected sources are:

- *in situ* observations, and
- NWP soil moisture fields

In situ observations

- From OzNet hydrological network in Murrumbidgee
- *Managed by Monash Uni. & Uni. Melbourne*
- *Data from 2002 – 2011*

NWP data

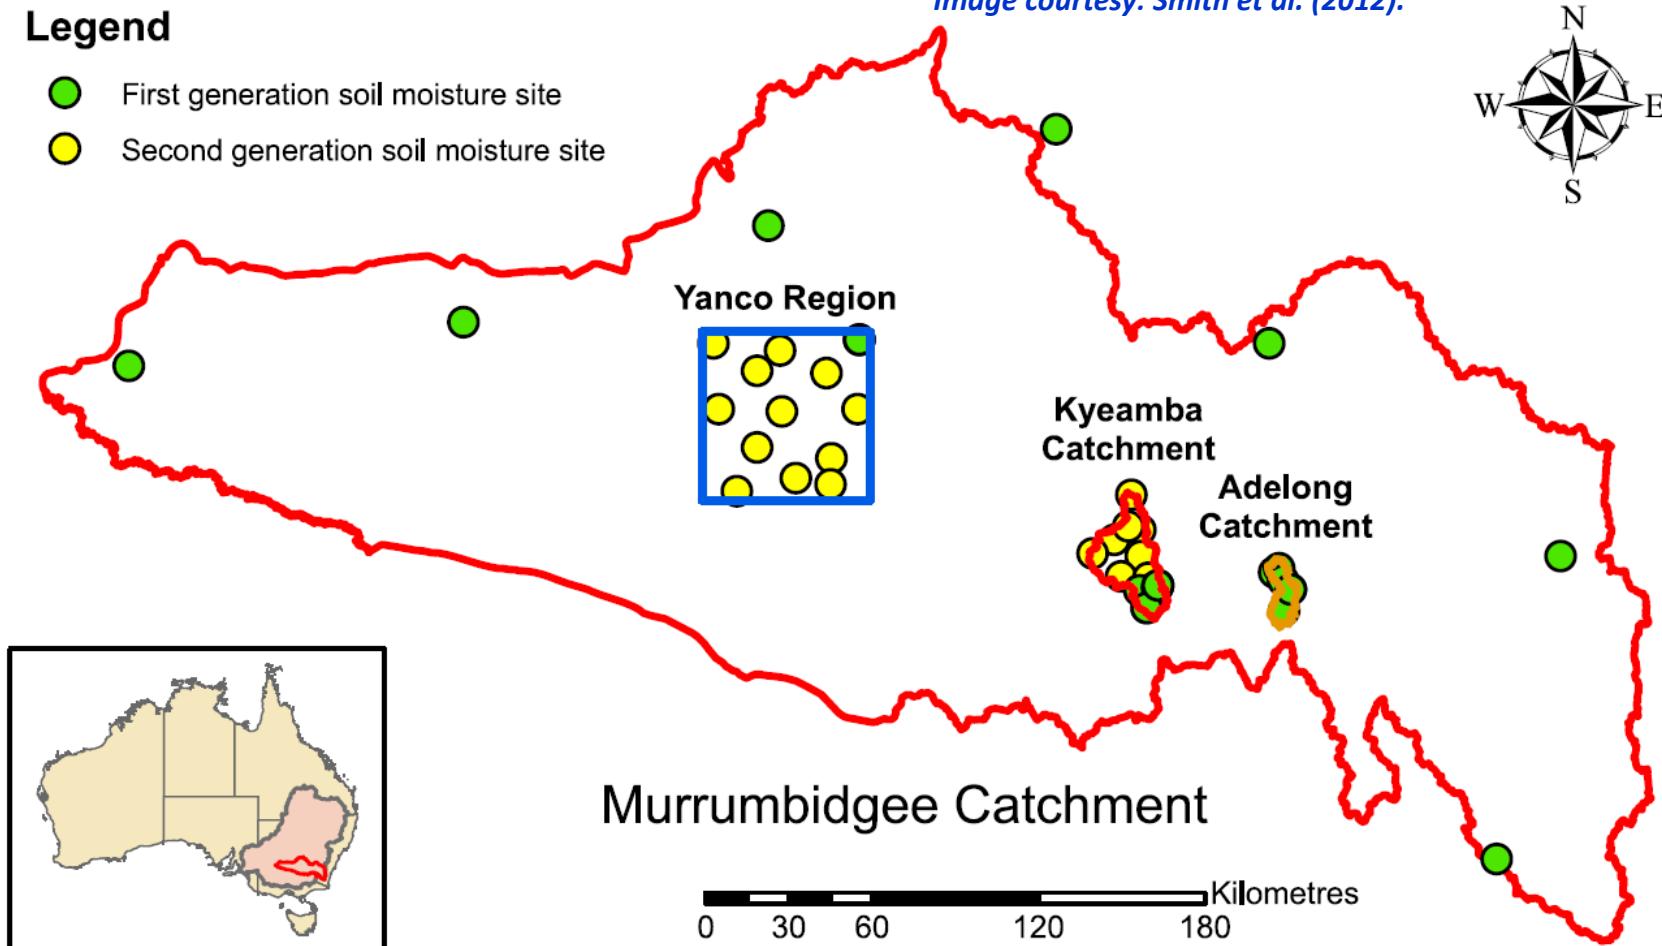

- *ACCESS operational global weather forecasting model (Suite Vn. – APSO)*
- *Spatial Resolution - ~80 km*
- *Uses "MOSES" land surface model*
- *Includes soil moisture nudging*

The Murrumbidgee Soil Moisture Monitoring Network.

Legend

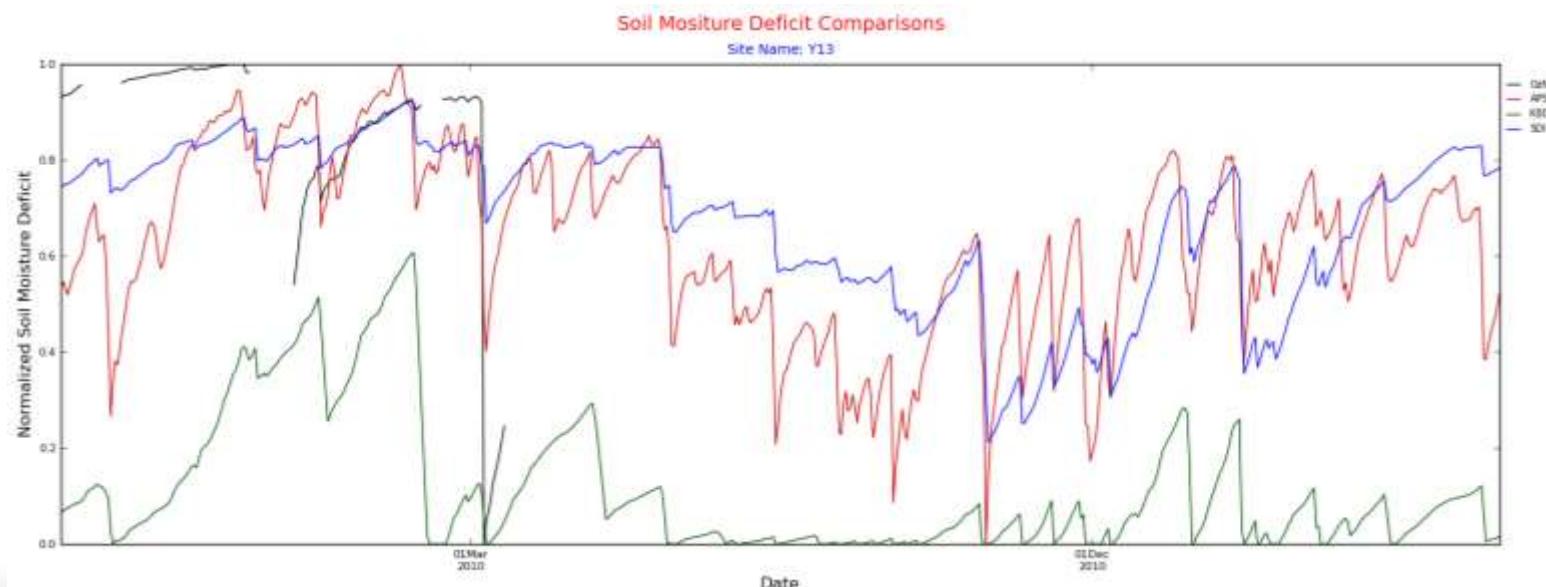

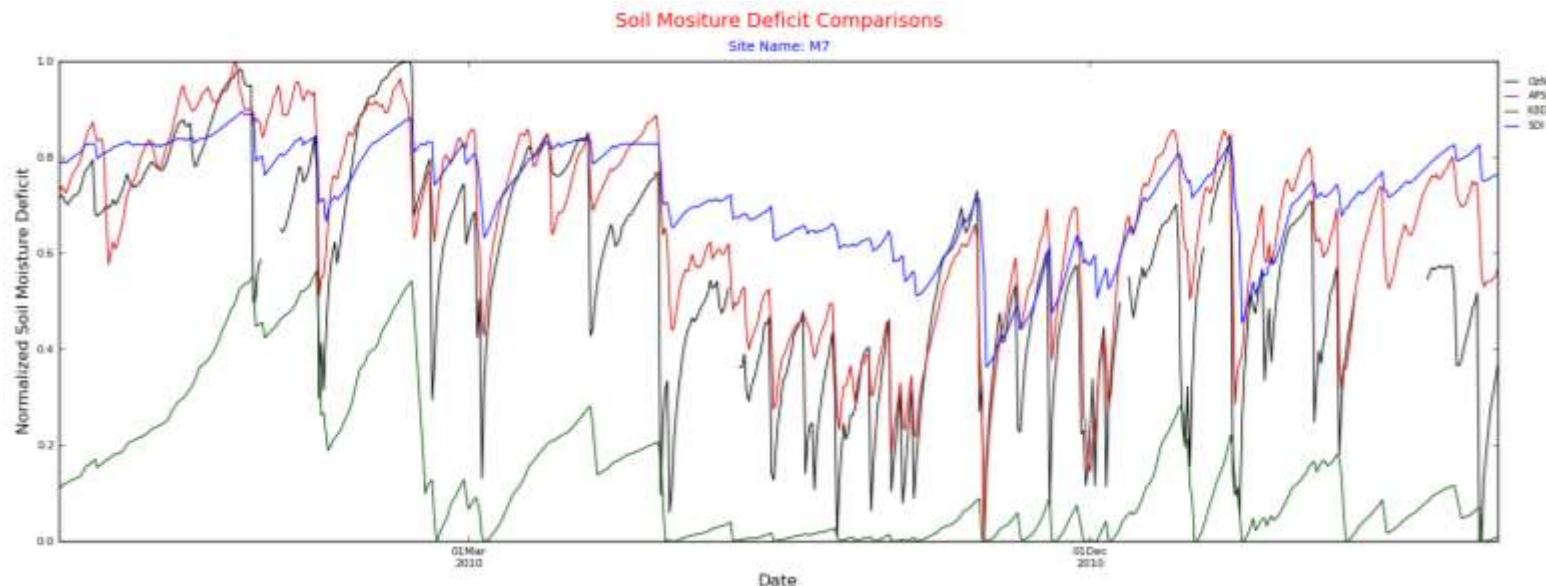

- First generation soil moisture site
- Second generation soil moisture site

Summary

- ❑ KBDI is wetter than SDI.
- ❑ NWP soil moisture show good agreement with observations.
- ❑ Despite the coarse resolution, NWP soil moisture deficit is better than SDI/KBDI.

ADDITIONAL SLIDES

KBDI formulation

$$KBDI_t = KBDI_{t-1} - P_{Net} + ET$$

$$ET = \frac{(203.2 - KBDI_{t-1})(0.968e^{0.0875T_{Max}+1.5552} - 8.3)}{1 + 10.88e^{-0.00173R_{annual}}}$$

SDI formulation

$$SDI_t = SDI_{t-1} - P_{Net} + ET$$

$$P_{Net} = Rain - Interception - Runoff$$

$$Interception = \begin{cases} R * Rain, & R * Rain + CW_{t-1} \leq C \\ C - CW_{t-1}, & R * Rain + CW_{t-1} > C \end{cases}$$

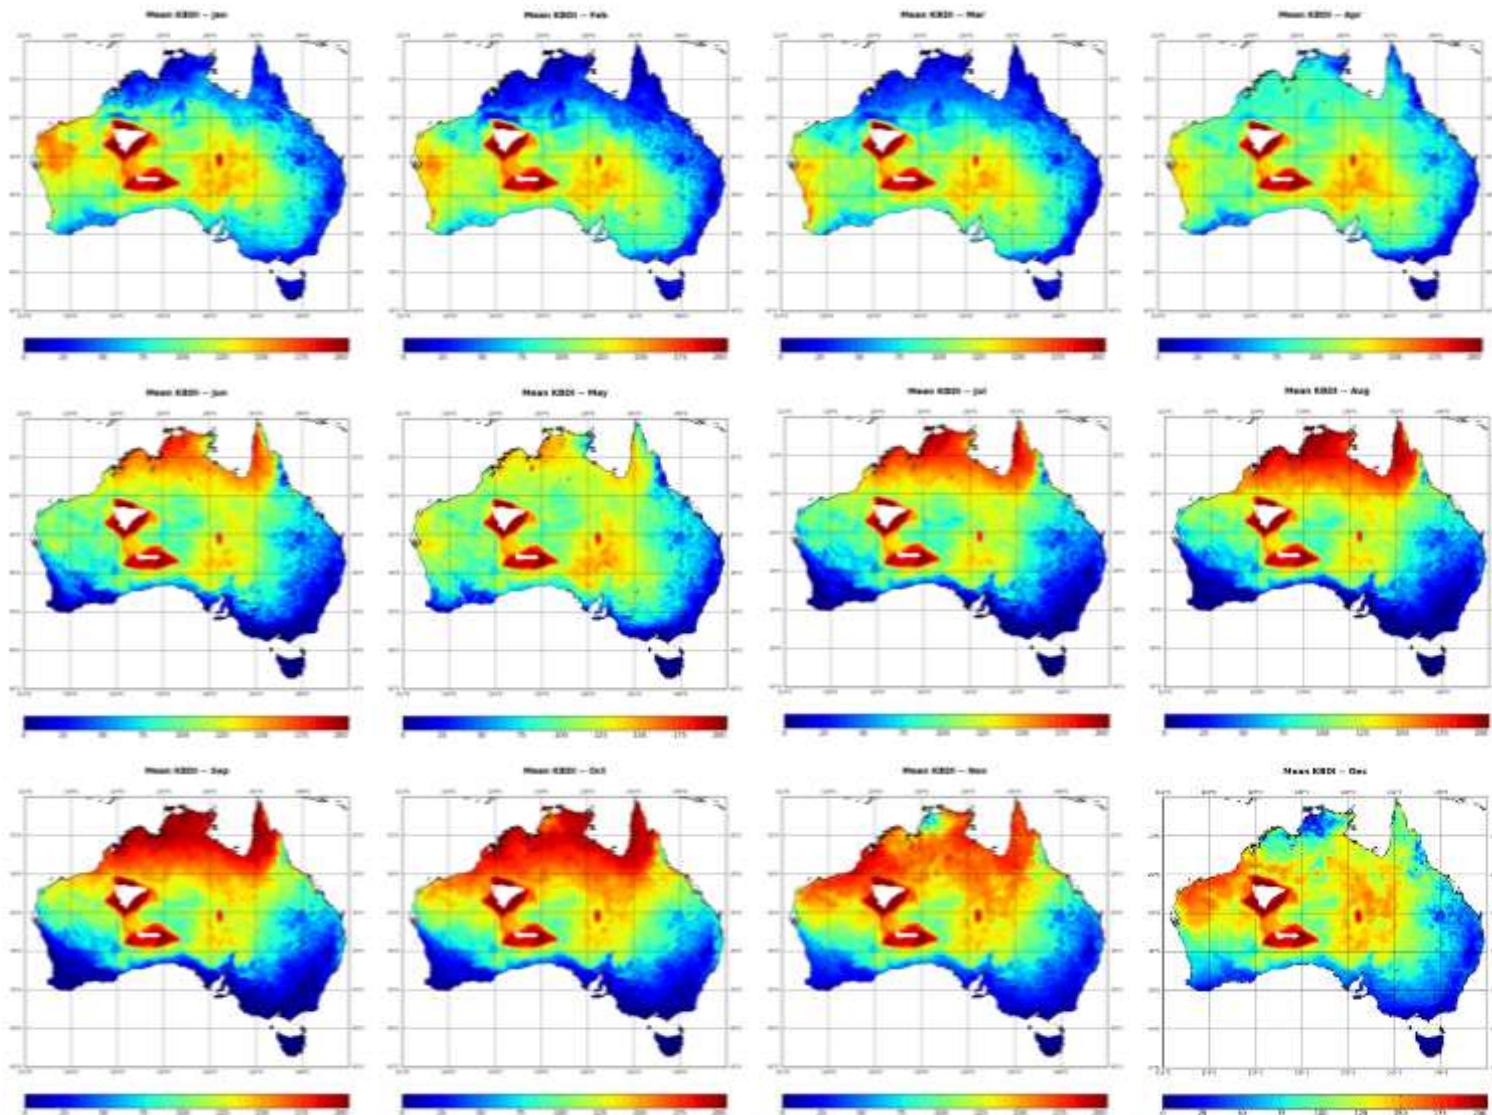

$$CW_t = \begin{cases} CW_{t-1} + Interception - W, & if Rain > 0 \\ 0, & if Rain = 0 \end{cases}$$

$$Runoff = FR \times Rain$$

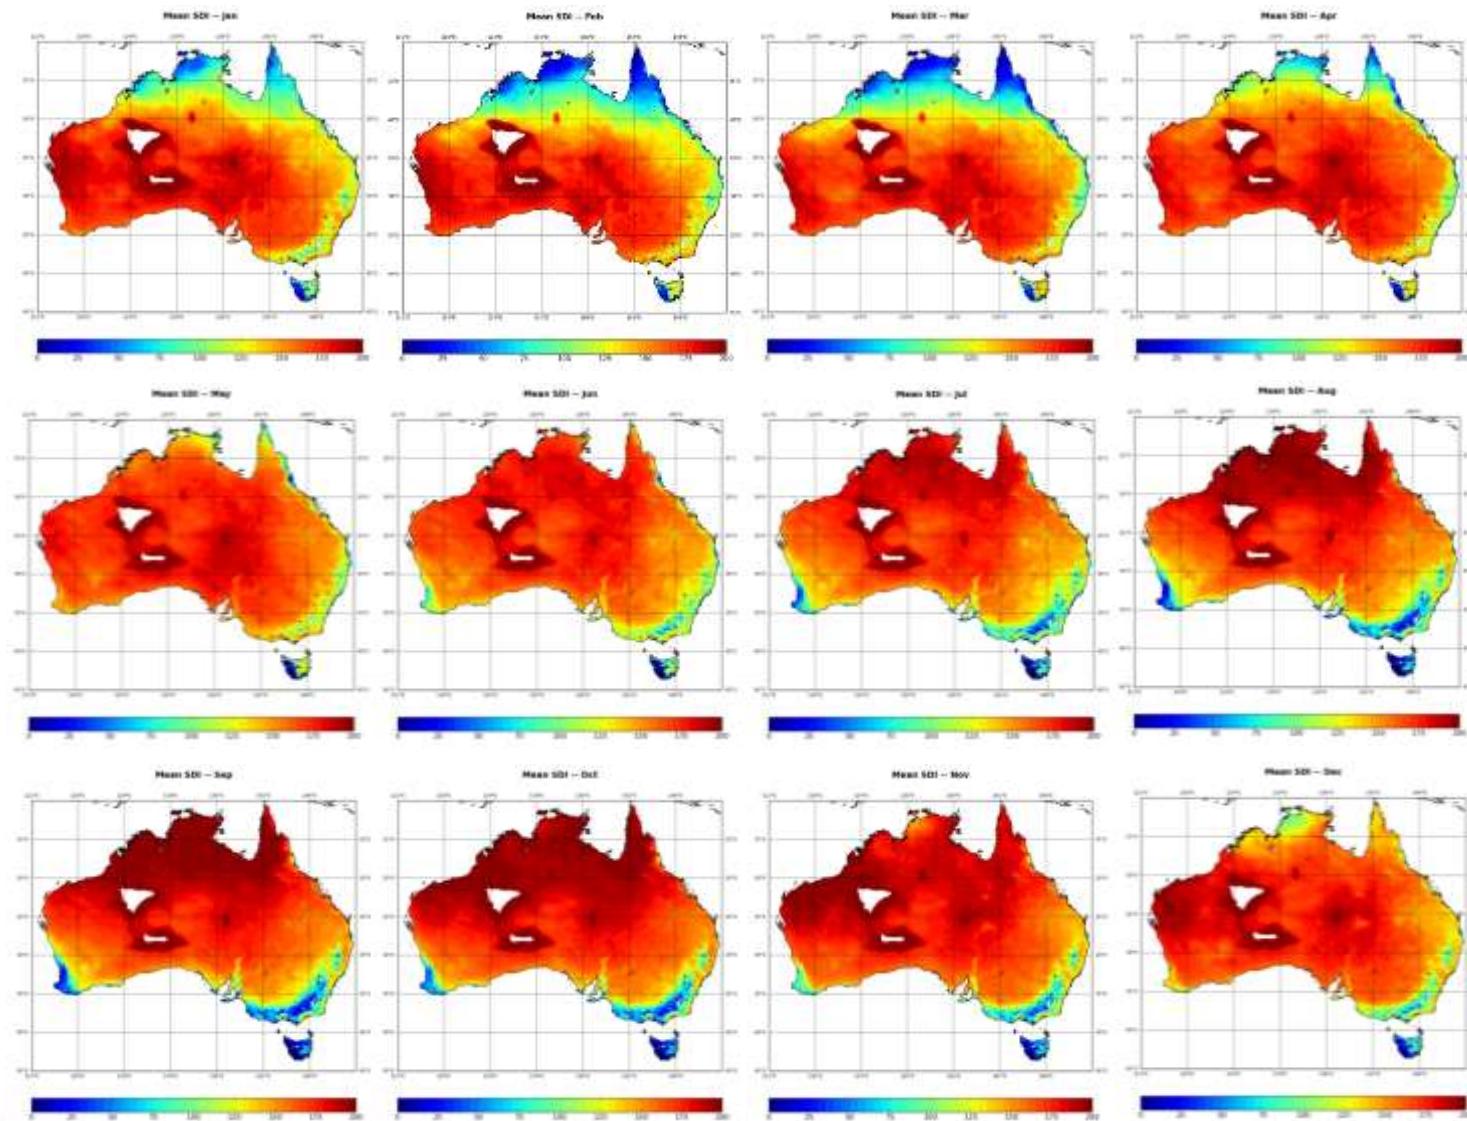

$$ET = a_i T_{Max} + b_i$$

Vegetation Class	O	A	B	C	D	E	F
Canopy rainfall interception fraction (R)	0	0.1	0.2	0.3	0.4	0.5	0.6
Canopy storage capacity (C)	0	0.5	1.0	2.0	2.5	3.5	4.0
Canopy loss per wet day (W)	0	0.5	0.5	0.5	0.5	0.5	1.0
Flash runoff fraction (FR)	1/10	1/20	1/30	1/40	1/50	1/60	1/70

Monthly average of KBDI based on data from 1974 - 2013 at ~5 km grid resolution

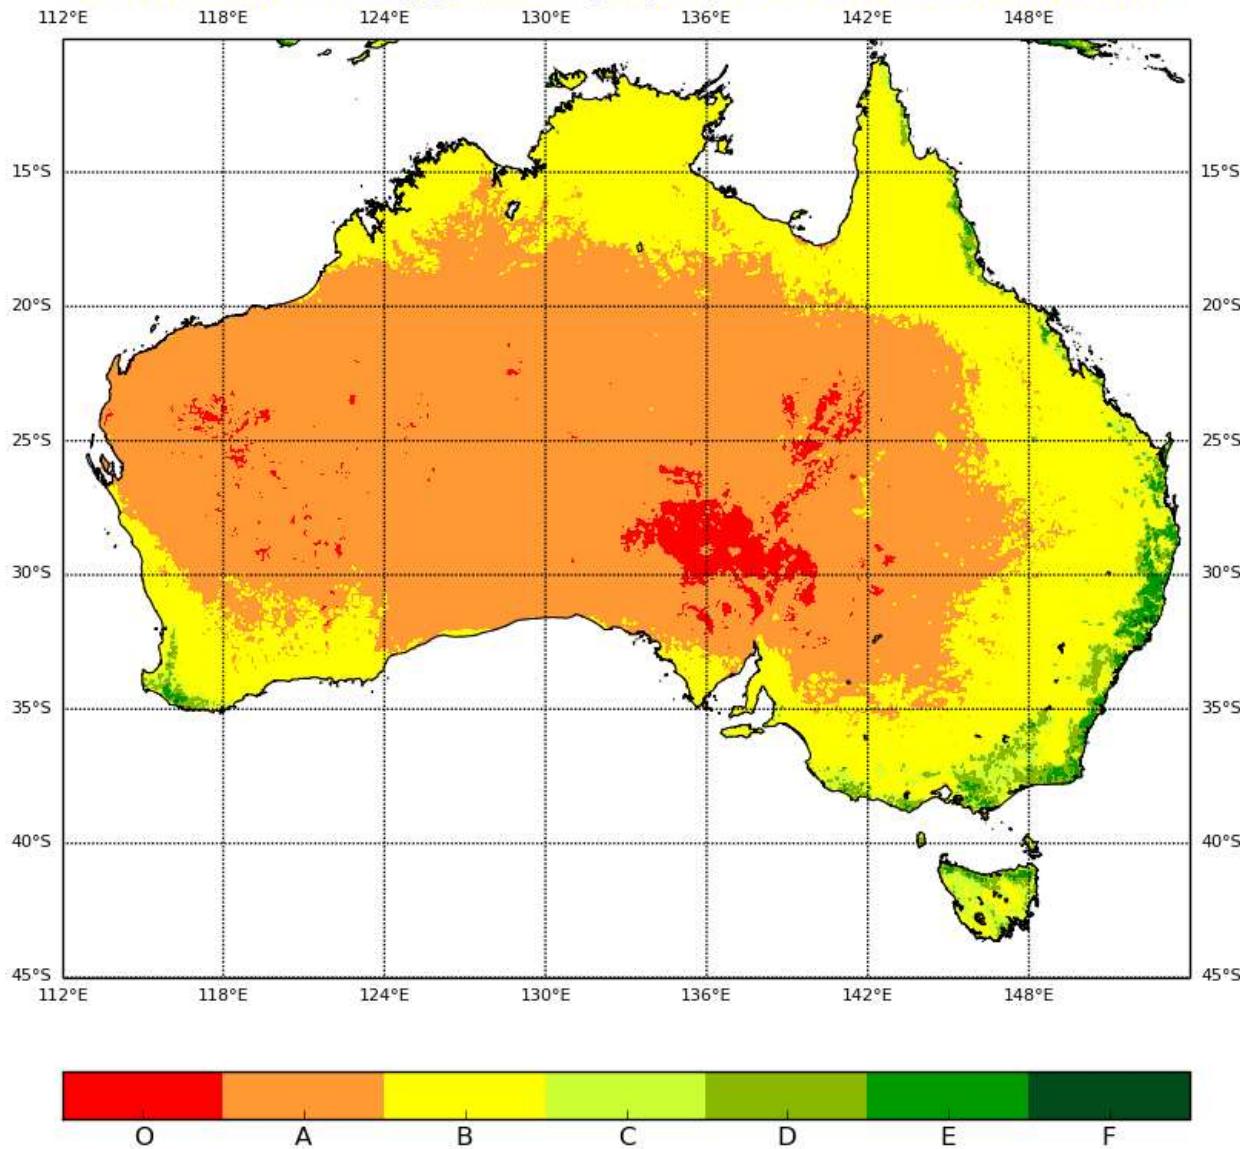

Monthly average of SDI based on data from 1974 - 2013 at ~5 km grid resolution

SDI Vegetation Class

(Based on mean LAI climatology generated using 10 years years of MODIS LAI data from 2003 - 2012).

Mean LAI

(Based on MODIS 8-day composite LAI data from 2002 to 2012)
